

How to plant bare rooted roses in spring

Planting period: March - May

- Only in spring: Prune the branches down to 15 cm.
- Cut the roots down to 20 – 30 cm.
- Soak your rose in pail of water (keep all roots immersed) for 12 – 24 hours before planting.
- Dig a hole in a sunny place, wide and deep enough to accept the roots of the plant.
- The addition of horn shavings or well-cured garden compost to the garden soil before planting will help ensure a strong growth. Alternatively you may use special rose substrate.
- The grafting point should be end up around 5 cm below ground level.
- Put the rose into the hole in an upright position, refill with soil.
- Water well afterwards.
- Pile the soil up to at least 20 cm upon branches. This will be a protection against frost and dehydration.
- Remove the mound, which covers the branches completely, only after 6 – 8 weeks.
